

Castlegem – New York PoP: Dedicated Trading Servers

Castlegem are pleased to announce that we are now upgrading our trading tuned dedicated server range to take additional advantage of our high availability low latency network in New York (AS18845) allowing high speed and throughput connections to all major exchanges in New York and Chicago.

Effective immediately, all dedicated trading servers will have dual gbps uplinks to separate HA routers with separate transit feeds. This will give our clients not only completely redundant uplinks, it will also give them flexibility of routing traffic through different transit feeds without our intervention. That way, clients may tune and optimise routes and latency themselves, depending on data feeds and exchanges used.

Get your bespoke development and hosting solution from Castlegem – the diamond hosting company among ISPs. Contact us today!
